Tips for Hoods

Hood

Make good use of your hood

Apart from extracting the disgusting fumes, hoods can also level the steam, high temperature and odours generated during cooking time. Please get your hood ready before cooking under any circumstances, even no fumes produced. Prevent fumes from spreading before the hood is ready. Moreover, this leads to a pleasant ambience in your kitchen and to avoid steam accumulated and condensed inside the hood; extends the lifespan of the hood in all.

Run on even finished cooking

Unpleasant odours and fume would stay in your cooking area if you stop the hood right after cooking. Try to run the hood for additional 10 minutes, this helps removing any lingering odours in the kitchen after cooking. Your kitchen can stay fresh anytime and make you pay less effort and time for cleaning your entire kitchen. If your hood has embedded with the run on programme, please activate with the instructions given at the user manual.

Keep Ventilating

Maintain adequate ventilation in the kitchen once the hood is switched on. If the current is low, the fume may not be completely extracted. Hence, not to operate any other ventilation devices at the same time to prevent the venting performance from dropping.

Regular Cleaning of Metal Filters

Spotless filters can maximize the efficiency of the hood, therefore regular cleaning of metal filters is the easiest yet important way to ensure your hood is at top performance and energy efficient. Generally, cleaning the metal filters every one to three months or once the indicator illuminates is recommended. Please follow the instructions in your user manual to clean the filters. Some anti-rust filters can be washed in dishwasher while discolor may occur during high temperature cleansing. If you wish to have new metal filters with your appliance, you are welcome to contact our Parts and Accessories Team.

Tips for Hobs

Hob

Choose Suitable Cookware

Magnet can be your shopping assistant to identify induction cookware. Simply check whether the magnet could be readily clings to the base of the cookware piece. At cooking, not to use over-sized cookware to avoid uneven heating and prevent from overheating due to the heat reflection to cooktop for gas hob.

Clean Properly With Right Agents

Clean the cooktop immediately after the hob turns cold whenever there is overflowing or spills. Use warm soap water with damp cloth to clean the hob if cold burnt-out is found. Do not use concentrated or abrasive cleaning agents or wire buff on hob surface. You may purchase our Ceramic Hob Maintenance Pack if needed (See next page).

Moreover, blockage of nozzle may lead to gas assemble inside the gas hob; internal heating and fire may be induced. Regular cleaning on burner caps with water or mild detergent and burner hobs with sharp objects is highly recommended to save you from domestic accidents.

Reassemble All Accessories Correctly After Cleaning

Pan supports, caps and burners may be moved at cleaning. Make sure they are reassembled correctly afterwards. Incorrect installation will seriously affect the flame to ignite properly and burn the hob and its accessories as well as energy wastage.

Say no to Improper Accessories

Placing additional cooking accessories (e.g. tinfoil cover) in between cookware and hob is dangerous. This may influence the temperature for heating and reduce the space for ventilation.

Check Your Gas Hob Regularly

To safely concern, we recommend you to arrange for a Registered Gas Contractor to conduct safety checks on your gas hobs at least once every 18 months.
